Abstracts

Electromechanical system simulation software is a type of engineering software used for modeling, simulating, and optimizing multi-physical domain coupled systems, including mechanical, electrical, hydraulic, and control systems. It supports the construction of virtual prototypes based on standards such as Modelica, Simulink, and FMI, enabling full-process digital twin analysis from conceptual design to performance verification. It is widely used in aerospace, automotive, robotics, and high-end equipment industries. Its upstream industry chain includes suppliers of operating systems, solver algorithm libraries, GPU computing hardware, and basic mathematical libraries. The midstream consists of core software developers who need capabilities in multidisciplinary coupled modeling, real-time simulation, code generation, and industry model library development. The downstream primarily targets manufacturing R&D departments, research institutes, and universities. Due to its reliance on software licensing and subscription services, the industry has low marginal costs and high technological barriers, resulting in a gross profit margin between 50% and 70%.

The global Electro-mechanical System Simulation Software market size was estimated at USD 455.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
