Abstracts

When an electric field is applied to electrocaloric materials, the electric dipole moments in the field align and the material heats up. The heat generated is dissipated via a heat sink, so that the material cools down again to the initial temperature. Once the electric field is removed, the alignment of the electric dipole moments in the field is reduced and the material cools down to a value below the initial temperature. Now it can absorb thermal energy from a heat source. This effect is highly reversible and can be used cyclically, making it possible to realize potentially highly energy-efficient cooling systems and heat pumps.

The global Electrocaloric Industrial Heat Pump market size was estimated at USD 75.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.65% during the forecast period.
