Abstracts

The electrochemical carbon monoxide sensor is a sensor that uses electrochemical principles to detect the concentration of carbon monoxide in the environment. It has the advantages of fast response, high sensitivity, and low cost. It usually consists of electrodes, electrolytes and working electrodes. When carbon monoxide molecules chemically react with the working electrode surface of the sensor, the current or voltage signal generated is proportional to the concentration of carbon monoxide in the environment. By measuring the changes in these electrical signals, the carbon monoxide concentration can be determined.

The global Electrochemical Carbon Monoxide Sensor market size was estimated at USD 85.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.85% during the forecast period.
