Report Overview

An Electrochemiluminescent Immunoassay Analyzer is a sophisticated analytical instrument used in the field of biochemistry and molecular diagnostics. This device employs electrochemiluminescence (ECL), a technique that combines the principles of electrochemistry and chemiluminescence, to detect and quantify specific biomolecules such as proteins or antibodies. The analyzer works by immobilizing capture molecules on a surface and allowing them to bind with target analytes present in a sample. Upon the application of an electric potential, the ECL reaction is initiated, generating light that is proportional to the concentration of the target analyte. This light emission is then detected and measured, allowing for the quantification of the analyte in the sample. The Electrochemiluminescent Immunoassay Analyzer is highly sensitive and specific, making it a valuable tool in research, clinical diagnostics, and drug development for the detection of various biomarkers and disease-related proteins.
