Report Overview

Electrocoagulation is a water and wastewater treatment process that utilizes the application of an electric current to remove contaminants, such as heavy metals, suspended solids, and organic pollutants, from the water. This process involves the generation of metal ions at the anode, which then form metal hydroxides and coagulate with the contaminants, leading to their removal from the water. The electrocoagulation process is advantageous due to its simplicity, low cost, and minimal use of chemicals. It is particularly effective in treating water with high concentrations of suspended solids and is often used in industries such as mining, agriculture, and textile manufacturing for water purification purposes. The process can be customized to target specific contaminants, making it a versatile solution for various water treatment applications.
