Report Overview

Electroformed Copper Mesh is a specialized material produced through a process called electroforming, which involves the deposition of copper onto a conductive mandrel using an electrolytic solution. This method results in a fine, uniform mesh with precise dimensions and high structural integrity. The product is characterized by its high electrical and thermal conductivity, making it ideal for applications in electronics, heat exchangers, and filtration systems. The mesh's properties, such as its porosity and surface area, can be tailored to specific requirements by adjusting the electroforming parameters. Additionally, electroformed copper mesh is known for its corrosion resistance and malleability, which allows for further processing and shaping post-production. This versatile material finds use in a wide range of industries, from aerospace and automotive to medical and chemical processing, where its unique combination of properties is highly valued.
