Abstracts

Electroless nickel-phosphorus plating is a chemical process that deposits an even layer of nickel-phosphorus alloy on the surface of a solid substrate, like metal or plastic. The process involves dipping the substrate in a water solution containing nickel salt and a phosphorus-containing reducing agent, usually a hypophosphite salt.[1] It is the most common version of electroless nickel plating (EN plating) and is often referred by that name. A similar process uses a borohydride reducing agent, yielding a nickel-boron coating instead.

The global Electroless Nickel Phosphorus Plating market size was estimated at USD 950.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
