## Abstracts

Electron Beam Curing (EBC) is a type of radiation curing technology. High-energy electron beams directly interact with the system to be cured to cause polymerization, grafting or cross-linking reactions, thereby curing the material. The electron beam (EB) curing process generates less heat than UV and LED curing, providing a more complete cure with virtually no odor. EB units use up to 95% less energy than thermal drying and up to 80% less energy than UV curing. Electron Beam Curing Solutions is an advanced technology for curing coatings, inks and adhesives. It uses high-energy electron beams to initiate chemical cross-linking reactions in materials, resulting in rapid curing and curing effects. This technology is commonly used in industrial fields such as printing, coating, bonding and composite materials. The Electron Beam (EB) Curing Solutions market is evolving rapidly as industries increasingly prioritize sustainability, efficiency, and high-performance materials. This technology is gaining traction across sectors such as packaging, automotive, electronics, and aerospace due to its ability to deliver fast, solvent-free curing without the need for additional heat or catalysts. EB curing offers significant advantages, including improved product durability, reduced environmental impact, and enhanced production speed. As regulatory pressures and consumer demand push for eco-friendly alternatives, businesses are adopting EB curing to meet these expectations while maintaining high quality and throughput. The market is also benefiting from ongoing technological advancements that are making EB systems more accessible and versatile for a wider range of applications.

The global Electron Beam Curing Solutions market size was estimated at USD 1713.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.10% during the forecast period.
