Abstracts

Electrostatic enamel powder coating is a process used to apply a durable and protective layer of enamel to metal surfaces. This technique involves spraying dry enamel powder onto a metal substrate, where the powder is electrically charged. The metal object, grounded to create an opposite charge, attracts the powder particles, ensuring an even and efficient coating. Once the powder is applied, the coated object is heated in a kiln, causing the powder to melt and form a smooth, hard finish. This type of coating is highly resistant to corrosion, chemicals, and weathering, making it ideal for applications requiring a robust and long-lasting surface. The electrostatic method is efficient and environmentally friendly, as it minimizes waste and does not require solvents.

The global Electrostatic Enamel Powder Coating market size was estimated at USD 5512.35 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.85% during the forecast period.
