Abstracts

Liquid electrostatic spray guns, just like conventional spraying equipment, rely on air or high pressure to atomize the lacquer. The particles of lacquer are then charged as they exit the nozzle. Different air nozzles cap and material, which create different spiral spray pattern. This spiral effect reduces lacquer-particle velocity. Therefore the lacquer will be atomized. The technique involves applying a charge, usually negative, to the coating material as it is atomized. The negatively charged spray droplets are attracted to any earthed surface; if the workpiece is earthed, the negatively charged droplets are attracted preferentially to it. This effect is so powerful that, with some objects, coating spray can be observed to ?wrap around?. In this way, the purpose of the electrostatic coating is achieved which can offer transfer efficiency up to 95% and minimize the over spraying phenomenon obviously.

The global Electrostatic Liquid Spraying Guns market size was estimated at USD 385.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.45% during the forecast period.
