Abstracts

Electrostatic porcelain enamel powder is a specialized coating material used for applying a durable and glossy finish to metal surfaces. This powder consists of finely ground glass particles and pigments, which are electrostatically charged and sprayed onto a metal substrate. The charged particles adhere uniformly to the surface, forming an even coating. Once applied, the coated object is heated in a kiln or oven, causing the powder to melt and form a smooth, glass-like enamel layer that is resistant to corrosion, chemicals, and high temperatures. This coating method is widely used in industries for appliances, kitchenware, and architectural panels due to its aesthetic appeal, durability, and protective qualities.

The global Electrostatic Porcelain Enamel Powder market size was estimated at USD 1245.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
