Report Overview

The Embolism Umbrella is a medical device specifically designed to prevent and manage embolic events, particularly during vascular interventions such as angioplasty or stenting. It is a retrievable device that can be deployed within the vasculature to capture and contain embolic material that may dislodge during the procedure. The primary function of the Embolism Umbrella is to reduce the risk of distal embolization, which can lead to complications such as stroke or peripheral artery occlusion. Made from biocompatible materials, it is engineered to be highly visible under fluoroscopy, allowing for precise placement and retrieval. The device is typically characterized by its expandable structure that can be collapsed for delivery and then expanded within the blood vessel to form a barrier that captures embolic debris.
