Report Overview

An Emergency Breakaway Valve is a safety device designed to automatically separate or "break away" from a pipeline or hose in the event of excessive force or tension, such as during a vehicle collision or equipment malfunction. This mechanism is crucial in preventing hazardous materials from being released into the environment or causing further damage. Typically, the valve is engineered with a weak link that gives way under a predetermined level of stress, allowing the connected sections to separate safely. The product is commonly used in industries handling flammable, explosive, or toxic substances, such as fuel distribution, chemical processing, and waste management, to ensure safety and compliance with environmental regulations. The design may also include a shut-off feature to prevent leakage after separation, further enhancing the safety measures in place.
