### Report Overview

Encapsulated Fertilizer is a type of controlled-release fertilizer that is designed to provide nutrients to plants over an extended period. It consists of a core containing the nutrient(s), typically a blend of essential macro and micronutrients, which is then surrounded by a protective coating or shell. This encapsulation allows for a slow and steady release of the nutrients into the soil, ensuring a more efficient uptake by plants and reducing the risk of nutrient leaching or loss. The encapsulation material can vary, including polymers, sulfur, or other biodegradable materials, and is chosen based on the desired release rate and environmental conditions. The primary benefits of encapsulated fertilizers include improved nutrient management, reduced application frequency, enhanced crop yield, and environmental sustainability by minimizing nutrient runoff and soil contamination.
