Abstracts

An enclosure-cooling air conditioner is a specialized type of air conditioning system designed specifically for cooling and maintaining optimal temperatures within electronic equipment enclosures. These enclosures are used to protect sensitive electronic components, such as servers, routers, control panels, or other heat-generating devices, from external environmental factors like dust, humidity, and excessive heat. Large-scale energy storage systems support the reliable operation of power grids. Cabinet air conditioners play an important role in adjusting load curves, shaving peaks and filling valleys, improving the utilization efficiency of distribution network equipment and lines, participating in power grid frequency modulation, and improving the power supply level of large power grids. The construction of communication sites is developing rapidly. With the advancement of 4G and 5G networks, ensuring the reasonable temperature range of components in the cabinet is an indispensable part of the industry. In addition, the batteries in the cabinet are very sensitive to temperature fluctuations, and the communication sites are directly deployed outdoors, and the environmental conditions vary greatly. Due to the influence of the sun, the temperature inside the cabinet is high and outdoor cooling is required. With the coverage of smart factories in the automotive industry, more and more factories have realized intelligent production management, using advanced technologies such as cloud, embedded, Internet of Things, RFID, edge computing, and automatic control to achieve high-level management such as wide-area networking of equipment, automatic data collection, rapid operation of equipment, process error prevention, and leakage prevention. In addition, the industrialization of new energy vehicles continues to advance, and the degree of electrification and intelligence of automobiles is increasing, requiring various industrial control cabinets to protect the control system. Undoubtedly, in order to ensure the stability of the system, the control of the temperature inside the cabinet is particularly important. The rapid popularization of new energy vehicles has led to a rapid growth in the demand for

supporting charging equipment, but at the same time, the cruising range of new energy vehicles is getting longer and longer, and the charging time of new energy vehicles is getting shorter and shorter, which puts higher requirements on the supporting charging piles. The construction of super charging stations has alleviated the problem of long charging time, but it has brought new challenges to the heat dissipation of the charging module, which will generate heat during normal operation. If this part of the heat is not converted in time, it will cause the temperature of the charging module to be too high, causing it to operate at a reduced rate, thereby affecting the charging efficiency, so temperature control equipment is needed to maintain the stable operation of the equipment. The rapid development of the manufacturing industry has brought more requirements to CNC machine tools and precision processing equipment, such as processing errors and part quality. When the machine tool runs continuously and quickly, a lot of heat will be generated, and thermal deformation will reduce the processing accuracy of the machine tool, so the cabinet air conditioner is needed to cool down in time.

The global Enclosure-Cooling Air Conditioner market size was estimated at USD 3261.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
