Report Overview

An Encoder Code Wheel, often simply referred to as a "code wheel," is a mechanical component used in rotary encoders and linear encoders to convert physical motion, either rotational or linear, into digital signals. The code wheel contains a pattern of alternating transparent and opaque segments, which are read by sensors in the encoder to determine the position, speed, and direction of the moving object. The sensors detect changes in light intensity as they pass over the segments of the code wheel, generating electrical signals that can be interpreted by electronic circuits to provide accurate position or motion data.
