Report Overview

End-of-life tire (ELT) Pyrolysis Carbon Black refers to the carbon black produced through the pyrolysis process of waste tires. Pyrolysis is a thermochemical decomposition process that breaks down the rubber and other organic compounds in waste tires at high temperatures in the absence of oxygen. The resulting carbon black is a valuable byproduct that can be used as a substitute for traditional carbon black in various applications, such as rubber reinforcement, pigments, and coatings. This process not only helps in recycling and repurposing waste tires but also contributes to reducing environmental pollution and conserving natural resources. The quality and properties of ELT Pyrolysis Carbon Black may vary depending on the pyrolysis conditions, feedstock composition, and post-treatment processes, making it a versatile and sustainable material in the tire and rubber industries.
