Abstracts

The endoscopic single-hole surgical robot is composed of a doctor's console, a patient's operating platform, a three-dimensional electronic laparoscope, surgical instruments and accessories, and is used for urological laparoscopic operations. Using single-hole operation can reduce the number of abdominal openings in patients, and has the advantages of less trauma for patients and faster postoperative recovery period. At the same time, the product's endoscope and surgical instruments have multiple active degrees of freedom, which can complete complex surgical operations in a small space, and the external robotic arm can remain still during the operation, avoiding the risk of collisions during the operation.

The global Endoscopic Single Port Surgical Robot market size was estimated at USD 450.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.65% during the forecast period.
