Report Overview

An Endotoxin Retentive Filter is a specialized filtration device designed to effectively capture and retain endotoxins, which are toxic components found in the outer membrane of gram-negative bacteria. This product is crucial in various industries, particularly in pharmaceutical and biotechnology, where the presence of endotoxins can compromise the safety and efficacy of drugs, vaccines, and other biological products. The filter is typically made of a porous membrane material that allows the passage of liquids while blocking endotoxins. It is engineered to have high endotoxin binding capacity and low protein binding, ensuring that the filtered product remains uncontaminated and retains its intended biological activity. The Endotoxin Retentive Filter is often used in downstream processing steps to ensure the purity and quality of the final product, thereby safeguarding patient health and meeting regulatory standards.
