### Report Overview

Endovascular Repair (EVAR) is a minimally invasive surgical procedure used to treat abdominal aortic aneurysms (AAA), a condition where the aorta, the body's main blood vessel, bulges or balloons out. During EVAR, a graft is inserted into the aorta through a small incision in the groin, allowing blood to flow through the graft rather than the weakened aortic wall. This procedure is designed to reduce the risk of aortic rupture, which can be life-threatening. EVAR is typically performed under general anesthesia and involves the use of imaging techniques such as fluoroscopy to guide the placement of the graft. It is considered a less invasive alternative to open surgical repair, as it does not require a large incision in the abdomen and has a shorter recovery time. However, EVAR may not be suitable for all patients, and the decision to use this procedure depends on various factors, including the size and location of the aneurysm, the patient's overall health, and the surgeon's assessment.

In 2024, the global Endovascular Repair (EVAR) market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
