Abstracts

Epidermal growth factor receptor inhibitors are a class of drugs used to treat diseases such as tumors. They act on the epidermal growth factor receptor (EGFR) and block the signaling pathway of this receptor, thereby inhibiting the growth, division and spread of tumor cells. EGFR is a membrane receptor tyrosine kinase that regulates cell growth and differentiation in normal cells. However, it is overexpressed or mutated in some tumor cells, leading to abnormal activation and thus promoting tumor development. Epidermal growth factor receptor inhibitors inhibit tumor growth and metastasis by binding to EGFR and blocking its activation. These drugs usually include small molecule tyrosine kinase inhibitors and monoclonal antibodies, which are widely used in the treatment of various malignant tumors such as lung cancer and colorectal cancer.

The global Epidermal Growth Factor Receptor Inhibitors market size was estimated at USD 6712.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.50% during the forecast period.
