Report Overview

An Epoxy Cast Dry-type Transformer (?35KV) is a type of electrical transformer designed for applications requiring high efficiency and safety, particularly in environments where the risk of fire or explosion is a concern. This transformer is characterized by its dry-type construction, which means it does not use oil or other liquid dielectrics that can pose a fire hazard. Instead, it employs a solid insulation material, typically epoxy resin, which encapsulates the windings and other internal components. The epoxy casting process provides excellent electrical insulation and mechanical strength, ensuring the transformer's durability and reliability. With a voltage rating of up to 35 kilovolts, these transformers are suitable for a wide range of industrial, commercial, and residential applications where medium voltage levels are present. They are known for their low maintenance requirements, high resistance to short circuits, and the ability to operate in environments with limited space or where oil-filled transformers are not feasible.
