### Report Overview

Erythritol is a sugar alcohol commonly used as a low-calorie sweetener in food and beverages, offering approximately 70% of the sweetness of sucrose with negligible calories and a minimal glycemic impact. It occurs naturally in some fruits and fermented foods but is primarily produced commercially through the fermentation of glucose by yeast or fungi. Unlike other sugar alcohols, erythritol is well-tolerated by most consumers, as it is absorbed in the small intestine and excreted unchanged in urine, reducing gastrointestinal side effects. Its heat stability, solubility, and non-cariogenic properties make it suitable for baked goods, beverages, confectionery, and dairy products, aligning with growing consumer demand for sugar-free, diabetic-friendly, and keto-compliant food options. The market for erythritol is expanding due to rising health consciousness, increasing prevalence of diabetes and obesity, and regulatory support for sugar reduction initiatives in many countries. However, competition from other natural sweeteners like stevia and monk fruit, as well as production cost challenges, may influence market dynamics. Major food and beverage manufacturers are increasingly incorporating erythritol into product formulations, driving growth in both developed and emerging markets.
