Report Overview

An Esophageal Metal Stent is a medical device primarily used for the treatment of esophageal strictures or obstructions, which can be caused by various conditions such as cancer, inflammation, or injury. This stent is typically made from a flexible, expandable metal mesh, which is designed to be inserted into the esophagus through an endoscopic procedure. The purpose of the stent is to provide structural support and maintain patency of the esophagus, thereby alleviating symptoms such as dysphagia (difficulty swallowing) and facilitating the passage of food. Esophageal Metal Stents can be either temporary or permanent, depending on the patient's condition and treatment goals.
