Etching SiC is a particularly challenging process since the material has a hardness approaching that of diamond. It also has a very stable chemical structure. SiC is more difficult to dry etch than some other compound layers e.g. GaAs, AlGaAs, InP, which can be etched in a conventional inductively coupled plasma (ICP) system. This report studies the etching system for compound semiconductors, including SiC, GaN, GaAs, and InP, etc.

The global Etching Equipment for Compound Semiconductors market size was estimated at USD 483.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.60% during the forecast period.
