Report Overview

Ethylene Propylene Monomer (EPM) is a type of synthetic rubber that is derived from the copolymerization of ethylene and propylene monomers. This material is known for its excellent resistance to heat, aging, and weathering, as well as its outstanding electrical insulation properties. EPM is characterized by its flexibility, resilience, and resistance to a wide range of chemicals, making it suitable for various applications such as automotive parts, seals, hoses, and cable insulation. It is also recognized for its ability to withstand extreme temperatures, both hot and cold, and its low-temperature flexibility, which is crucial for applications in harsh environments. EPM's properties can be tailored through the control of the ethylene-to-propylene ratio in its composition, allowing for the creation of materials with specific performance characteristics to meet the demands of different industries.
