Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on EV Final Drive competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of EV final drives reached approximately 18.26 million units, with an average market price of around USD 117 per unit. EV Final Drive refers to the gear mechanism in an electric vehicle that delivers the final stage of torque conversion from the motor to the wheels. It typically consists of a set of gears that reduce the motor's high rotational speed to a lower, more usable speed while increasing torque output to drive the wheels efficiently. Unlike traditional internal combustion engine vehicles, electric vehicles usually integrate the final drive with the electric motor and transmission system in a more compact and efficient layout. The EV final drive plays a critical role in vehicle performance, including acceleration, energy efficiency, and noise reduction.

The global EV Final Drive market size was estimated at USD 2138.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 19.30% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global EV Final Drive market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
