Abstracts

The EV Liquid-cooled Electric Drive System refers to a type of electric drive system used in electric vehicles (EVs) that utilizes a liquid cooling system to regulate the temperature of the electric motor and other components. The liquid cooling system in the EV Liquid-cooled Electric Drive System helps in maintaining the optimal temperature of the electric motor and power electronics. It circulates a coolant, usually a mixture of water and ethylene glycol, through channels or pipes that are in direct contact with the motor and electronics. This helps dissipate the heat generated during operation and prevents overheating, which can negatively impact the performance and lifespan of the components. By using a liquid cooling system, the EV drive system can operate more efficiently and reliably, as it can maintain a consistent temperature range. This allows the electric motor to deliver its maximum power output consistently, resulting in improved performance and longer component life. It also enables faster charging of the battery pack, as excessive heat generated during charging can be quickly dissipated.

The global Ev Liquid Cooled Electric Drive System market size was estimated at USD 1250.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
