Abstracts

An externally heated electric soldering iron is an electronic welding tool. Its main feature is that the heating resistor (i.e., the soldering iron core) is located outside the soldering iron tip. The heat is transferred to the soldering iron tip by external heating, thereby heating the welding point. An externally heated electric soldering iron usually consists of a soldering iron tip, a soldering iron core, a shell, a wooden handle, a power lead, a plug, and other parts. The soldering iron core is a key component of the electric soldering iron. It is composed of a heating wire wound in parallel on a hollow porcelain tube, insulated by a mica sheet in the middle, and two wires are led out to connect to a 220V AC power supply.

The global External Heating Electric Soldering Iron market size was estimated at USD 85.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.15% during the forecast period.
