Abstracts

External pressure ultrafiltration membrane is a membrane separation technology that utilizes pressure difference. Its working method is that the raw liquid such as water source penetrates through the hollow fiber membrane filaments from the outside to the inside to become the permeate, and the trapped substances remain in the hollow fiber membrane. external. This ultrafiltration membrane is suitable for water with poor water quality. It can filter out harmful substances such as rust, sediment, suspended solids, colloids, bacteria, and macromolecular organic matter in the water, and can retain some mineral elements that are beneficial to the human body. The difference between external pressure ultrafiltration membrane and internal pressure ultrafiltration membrane is that external pressure ultrafiltration membrane has an independent inner wall support layer and will not be crushed by external pressure, while internal pressure ultrafiltration membrane does not have independent inner wall support layer, but external pressure filtration can also be used, but it must be 50% lower than the normal operating pressure.

The global External Pressure Ultrafiltration Membrane market size was estimated at USD 1250.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
