Report Overview

An External Retaining Ring, also known as an E-Clip or a Circlips, is a mechanical fastener used to secure components in place within a system. It is typically made from materials such as spring steel or stainless steel and is designed to be installed into a groove on the outer circumference of a shaft or hole. The ring's shape allows it to be compressed and then expand back to its original shape once released, creating a tight fit around the component it is retaining. This product is commonly used in various industries, including automotive, aerospace, and machinery manufacturing, to prevent axial movement of parts such as bearings, gears, and pulleys. The external retaining ring's primary function is to maintain the position of components within an assembly, ensuring proper alignment and preventing unwanted disassembly or movement during operation.
