Abstracts

Extracorporeal Shock Wave Therapy Machines are medical devices that promote the body's natural healing process and accelerate tissue repair through extracorporeal stimulation. When the extracorporeal shock wave therapy machine is operating, it will generate a series of mechanical wave vibrations, which are transmitted to the body, thereby stimulating the damaged area. As a result of this stimulation, the body produces a series of biological responses, including increasing blood circulation, promoting tissue regeneration, reducing pain, and improving motor function, among others. These reactions help reduce pain and promote healing. Its main advantage is rapid pain relief and restoration of range of motion. Because its treatment is non-invasive and does not require anesthesia, it is ideal for accelerating and healing multiple indications caused by acute and chronic pain.

The global Extracorporeal Shock Wave Therapy Machines market size was estimated at USD 685.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.35% during the forecast period.
