Report Overview

Extruded Graphite Bipolar Plates are specialized components utilized in fuel cell technology, particularly in proton exchange membrane (PEM) fuel cells. These plates serve as both current collectors and separators between adjacent cells within the fuel cell stack. Made from extruded graphite, they are known for their excellent electrical and thermal conductivity, which are critical for efficient operation of the fuel cell. The extrusion process enhances the mechanical strength and structural integrity of the plates, allowing them to withstand the pressures and conditions within a fuel cell. They are designed to have flow channels for the distribution of gases (such as hydrogen and oxygen) and coolant, ensuring uniform distribution and minimizing contact resistance. The material's resistance to corrosion and high-temperature stability makes extruded graphite bipolar plates suitable for long-term operation in various environments, including automotive and stationary power applications.
