Report Overview

An eyeless suture needle is a specialized surgical tool used in medical procedures for stitching tissues together. It is characterized by the absence of an eye at the end of the needle, which is a departure from traditional suture needles that have an eye for threading the suture material. This design allows for a smoother passage through tissues, reducing trauma and the risk of tearing delicate tissues. The eyeless suture needle is typically used with a suture passer or a needle driver to guide the suture thread through the tissue. It is particularly beneficial in microsurgery and ophthalmic procedures where precision and minimal tissue damage are crucial. The lack of an eye also means that there is no risk of the suture thread getting caught or tangled in the eye, which can be an advantage in certain surgical techniques.
