Report Overview

Fan-out packaging technology is an advanced semiconductor packaging technique that enables the redistribution of input/output (I/O) connections from a small chip to a larger panel or substrate. This technology allows for a higher density of I/O connections and improved electrical performance compared to traditional fan-in packaging methods. In fan-out packaging, the chip is placed in the center of a panel, and the I/O connections are extended outwards, or "fanned out," to the edges of the panel. This process involves the use of specialized materials, such as mold compounds and redistribution layers, to create the necessary electrical connections and protect the chip. Fan-out packaging technology is particularly beneficial for high-performance applications, as it allows for increased bandwidth, reduced power consumption, and improved thermal management.
