### Report Overview

FAPI for Tumor Treatment refers to a targeted therapy approach that utilizes Folic Acid (FA) as a vehicle to deliver anti-cancer agents directly to tumor cells. This innovative treatment strategy leverages the fact that many cancer cells overexpress folate receptors, which can be exploited for selective drug delivery. By conjugating anti-cancer drugs to folic acid, the drug-FAPI complex is preferentially taken up by tumor cells expressing high levels of folate receptors, thereby increasing the drug's efficacy and reducing systemic toxicity. This approach has the potential to improve treatment outcomes for various types of cancer, including breast, ovarian, and lung cancers, among others. The FAPI-based therapy is designed to be more selective and less harmful to healthy cells, offering a promising avenue for personalized and?? medicine in oncology.
