Report Overview

The Fast Ethernet Single-Mode Fiber Optic Transceiver is a networking device designed to transmit and receive data at 100 Mbps over single-mode fiber optic cables, typically used for long-distance communication due to its low signal attenuation and high bandwidth capabilities. These transceivers convert electrical signals into optical signals and vice versa, enabling seamless integration between copper-based Ethernet networks and fiber optic infrastructures. They are widely deployed in telecommunications, enterprise networks, and industrial applications where reliable, high-speed data transmission over extended distances (often exceeding 10 km) is required. Key features include compatibility with standards such as IEEE 802.3u, support for wavelengths like 1310 nm or 1550 nm, and hot-pluggability for ease of installation. The demand for these transceivers is driven by the growing need for scalable, future-proof network solutions, particularly in sectors like data centers, smart cities, and 5G backhaul networks, where single-mode fiber's superior performance over multimode fiber in long-range applications is critical.
