Report Overview

The Fecal Immunochemical Test (FIT) Kits are diagnostic tools designed to detect the presence of occult (hidden) blood in human feces. These kits utilize immunochemical technology to identify minute amounts of blood that may not be visible to the naked eye, which can be indicative of various gastrointestinal conditions, including colorectal cancer. FIT Kits are typically non-invasive, easy-to-use, and can be administered at home, making them a convenient option for initial screening. The test involves collecting a small fecal sample, which is then applied to a test card or cartridge. The presence of blood is detected through the reaction of antibodies with specific antigens found in human hemoglobin. FIT Kits are an important component of colorectal cancer screening programs, as they can help identify individuals who may require further diagnostic procedures, such as colonoscopy, to confirm or rule out the presence of cancerous or pre-cancerous lesions.
