## Abstracts

A feed and forage analysis service is a specialized analytical service designed to assess the nutritional composition, quality, and safety of animal feed materials (such as grains, concentrates, and premixes) and forage crops (like hay, silage, and pasture grasses). This service involves using standardized laboratory techniques to measure key parameters including moisture content, crude protein, fiber (e.g., neutral detergent fiber [NDF], acid detergent fiber [ADF]), fat, ash, minerals (e.g., calcium, phosphorus, potassium), vitamins, and anti-nutritional factors (e.g., mycotoxins, tannins). It also evaluates digestibility and palatability, providing critical data for formulating balanced diets that meet the specific nutritional requirements of livestock (e.g., cattle, poultry, swine) across different life stages. By ensuring feed and forage meet regulatory standards and optimizing nutrient utilization, these services support livestock health, productivity, and sustainability in agriculture. They are essential for farmers, feed manufacturers, and researchers to monitor feed quality, address nutritional deficiencies, and mitigate risks associated with contaminated or substandard feed materials.

The global Feed and Forage Analysis Service market size was estimated at USD 529.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
