Abstracts

Femtosecond lasers in biological imaging are a special type of laser that can produce extremely short pulses, usually in the range of femtoseconds (1 femtosecond = 10^{-15} seconds) to picoseconds (1 picosecond = 10^{-12} seconds) level. The characteristics of this ultrashort pulse make it an important application in the field of biological imaging. The main role of femtosecond lasers is in imaging technologies such as optical microscopy, fluorescence imaging, and optical coherence tomography (OCT). Its high resolution and high contrast characteristics make non-invasive imaging of biological samples possible. Femtosecond lasers usually use laser pulses through pulse compression technology to generate ultrashort pulses to meet the needs of biological imaging, such as high-resolution imaging at the cellular, tissue or biomolecule level.

The global Femtosecond Lasers In Biological Imaging market size was estimated at USD 285.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.85% during the forecast period.
