Abstracts

Optical frequency combs are specialized lasers that act like a ruler for light. They measure exact frequencies of light ? from the invisible infrared and ultraviolet to visible red, yellow, green and blue light ? quickly and accurately. These Nobel Prize-winning devices fill an important technological gap. Optical frequency combs allow scientists to measure and control light waves as if they were radio waves. With optical frequency combs, technologies that employ radio and microwave frequencies ? such as clocks, computers and communications ? are now seamlessly connected to optical waves that oscillate at 10,000 times higher frequencies. Optical frequency combs began as part of NIST scientists? vision for better optical atomic clocks in the late 1990s. Today, NIST scientists are at the forefront of advancing these tools, and they have found uses beyond just timekeeping. Femtosecond laser optical frequency comb, referred to as femtosecond light comb, is a kind of pulse light with pulse interval at femtosecond level. In time domain, it is manifested as a series of ultra-short pulses with time width at femtosecond level; in frequency domain, it is manifested as a series of single chromatographic lines with equal frequency interval, fixed position and extremely wide spectral range.

The global Femtosecond Optical Frequency Combs market size was estimated at USD 450.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.45% during the forecast period.
