Report Overview

The Fenestrated Screw System is a specialized orthopedic implant designed for spinal surgeries, particularly for the treatment of spinal deformities and stabilization. It consists of a series of screws with fenestrations, or openings, that allow for the attachment of rods to provide structural support and correction of spinal curvatures. This system is engineered to accommodate the unique anatomical variations of individual patients, offering a customizable solution for spinal fusion and stabilization procedures. The fenestrated design also facilitates the passage of bone grafts, promoting fusion and healing. The system is typically used in complex spinal surgeries where traditional screws may not provide the necessary flexibility or precision, and it is an integral part of advanced spinal correction techniques.
