Abstracts

Ferritic nitrocarburized brake rotors refer to brake rotors that have undergone a specialized surface treatment process to enhance their performance and durability. This process involves diffusing nitrogen and carbon into the surface of the ferritic (iron-based) material at relatively low temperatures. The result is a hard, wear-resistant surface layer that improves the rotor's resistance to corrosion and reduces brake dust production. Ferritic nitrocarburizing is particularly valued in the automotive industry for extending the lifespan of brake components and improving braking efficiency, making it a popular choice for both standard and high-performance vehicles.

The global Ferritic Nitrocarburized Brake Rotors market size was estimated at USD 185.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
