Report Overview

A Field Emission Electron Gun (FEG) is a sophisticated component utilized in various scientific and industrial applications, particularly in electron microscopy and electron beam lithography. It functions by generating a highly focused and stable beam of electrons through the process of field emission, where electrons are extracted from a sharp emitter tip under the influence of a strong electric field. The FEG is designed to provide a high current density and a small virtual source size, which are crucial for achieving high-resolution imaging and precise material processing. The product typically consists of a vacuum chamber, an emitter tip made from a material like tungsten or a semiconductor, and a series of electrodes that control the electron beam's trajectory and focus. The FEG's performance is characterized by its brightness, coherence, and stability, making it a critical element in advanced electron beam applications where high precision and control are required.
