Report Overview

Fire Retardant Wood is a type of engineered wood product that has been specifically treated to reduce its flammability and enhance its resistance to fire. This treatment involves the application of chemical compounds or fire retardants that modify the wood's structure, making it more difficult for flames to spread across its surface. The primary purpose of fire retardant wood is to provide enhanced safety in construction, particularly in areas prone to wildfires or where building codes require fire-resistant materials. It is commonly used in building exteriors, interior paneling, and furniture, offering a balance between aesthetics and safety. The effectiveness of fire retardant wood is often measured by its ability to slow down the spread of flames, reduce the release of toxic fumes, and maintain structural integrity under high temperatures.
