Report Overview

Fire ventilators are specialized equipment designed to manage smoke and heat during firefighting operations. They are typically large, manually operated devices that create openings in the roof or walls of a burning structure. The primary function of fire ventilators is to remove smoke, toxic gases, and heat from the interior of a building, thereby improving visibility and air quality for firefighters. This allows them to more effectively locate and extinguish the fire, as well as to rescue any trapped individuals. Fire ventilators can also help prevent the spread of fire by reducing the pressure inside the building, which can otherwise force flames and smoke to spread through unburned areas. These devices are an essential tool in the firefighting arsenal, contributing to the safety of both firefighters and civilians during emergencies.
