### Report Overview

Fish-oil based drugs are a class of pharmaceutical products that incorporate fish oil as their primary active ingredient. Fish oil is rich in omega-3 fatty acids, specifically eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA), which are known for their health benefits, particularly in managing cardiovascular health, reducing inflammation, and supporting brain function. These drugs are typically used to treat conditions such as high triglyceride levels, certain types of heart disease, and to support cognitive health. They may also be prescribed for other health issues where the anti-inflammatory properties of omega-3 fatty acids are beneficial. Fish-oil based drugs are available in various forms, including capsules, tablets, and liquid formulations, and are often derived from fish species like anchovies, sardines, and mackerel. The use of these drugs should be guided by medical professionals, as they can interact with other medications and may have side effects.
