Report Overview

A Fixed Titanium Plate with Loops is a medical device primarily used in orthopedic surgeries, specifically for the fixation and stabilization of bones. Made from titanium, a lightweight and biocompatible material, this plate features multiple loops integrated into its design. These loops serve as anchor points for screws, allowing for secure attachment to the bone fragments that need to be held in place during the healing process. The fixed nature of the plate indicates that it is not designed for dynamic compression or adjustable positioning, but rather for rigid immobilization. This type of implant is commonly used in fractures, osteotomies, or joint replacement surgeries where a strong, stable, and permanent fixation is required to promote bone healing and restore structural integrity.
