## Abstracts

Flash spinning is a method for forming ultrafine fibers into a web. The diameter of the spinning fiber is generally between 0.1-10um. This method was successfully developed by DuPont in 1957. Flash Spinning Nonwovens have many characteristics such as light weight, high strength, tear resistance, waterproof and breathable, high barrier, printable, recyclable, and harmless treatment. It combines the advantages of paper, film and cloth and is widely used in many fields such as high-value medical device packaging, medical protection, industrial protection, industrial packaging, building decoration, special printing and cultural and creative products.

**Market Drivers** Increased demand in the downstream market is the main driving force for the market's continued growth. For example, in the construction field, with the development of the construction industry, the demand for high-performance protective materials such as breathable and waterproof roof membranes and thermal insulation layers has increased. In the field of medical protection, global public health events have driven the expansion of the medical protective materials market. National policy support is another driving factor for the market's continued growth. In many countries and regions, governments encourage the research and development and application of high-performance new materials.

**Competitive landscape** Flash-steamed nonwoven fabric manufacturers are concentrated in the United States and China. Due to the high technical difficulty, only three companies in the world, DuPont, Qingyun New Materials and Dangsheng New Materials, have achieved large-scale production. Among them, DuPont is the only one, and in 2024, it will occupy a market share of about 95% (calculated by revenue).

The global Flash Spinning Nonwovens market size was estimated at USD 2054.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 11.30% during the forecast period.
