Report Overview

Flat plate solar collectors are a type of solar energy harvesting device designed to absorb and convert solar radiation into thermal energy. These collectors consist of a flat, usually rectangular, insulated box with a glass or plastic cover on one side and an absorber plate on the other. The absorber plate is typically made of metal, such as copper or aluminum, and is coated with a material that has high solar absorbance and low thermal emittance. The space between the cover and the absorber plate is filled with air or another insulating material to minimize heat loss. When sunlight strikes the collector, the absorber plate heats up, and this heat can be transferred to a fluid (such as water or antifreeze) that flows through tubes attached to the plate. The heated fluid is then circulated to provide heat for various applications, such as space heating, water heating, or industrial processes. Flat plate solar collectors are relatively simple and cost-effective, making them a popular choice for residential and commercial applications where moderate temperatures are required.
